Introspection report on objects

Module	Name	Version	Directory	Web
report_webkit	Webkit Report Engine		report_webkit	

This module adds a new Report Engine based on WebKit library (wkhtmltopdf) to support reports designed in HTML + CSS.
==
The module structure and some code is inspired by the report_openoffice module.
The module allows:

- HTML report definition
- Multi header support
- Multi logo
- Multi company support
- HTML and CSS-3 support (In the limit of the actual WebKIT version)
- JavaScript support
- Raw HTML debugger
- Book printing capabilities
- Margins definition
- Paper size definition
Multiple headers and logos can be defined per company. CSS style, header and
footer body are defined per company.
For a sample report see also the webkit_report_sample module, and this video:
http://files.me.com/nbessi/06n92k.mov
Requirements and Installation:

This module requires the ``wkhtmltopdf`` library to render HTML documents as
PDF. Version 0.9.9 or later is necessary, and can be found at
http://code.google.com/p/wkhtmltopdf/ for Linux, Mac OS X (i386) and Windows (32bits).
After installing the library on the OpenERP Server machine, you may need to set
the path to the ``wkhtmltopdf`` executable file in a system parameter named
``webkit_path`` in Settings -> Customization -> Parameters -> System Parameters
If you are experiencing missing header/footer problems on Linux, be sure to
install a 'static' version of the library. The default ``wkhtmltopdf`` on
Ubuntu is known to have this issue.

TODO:
-----
* JavaScript support activation deactivation
* Collated and book format support
* Zip return for separated PDF
* Web client WYSIWYG
